

SAFETY RELEASE JOINT

PRODUCT 801

The **TechWest Safety Release Joint** enables tubing to be retrieved above the release point should the tubing string become stuck in the wellbore at or below the packer. The safety release joint is positioned directly above the service packer which provides a disconnect point for the tubing in the event the packer will not release and allow the work string to be recovered. The release of the safety joint enables an overshot to be run along with jars and reconnect the work string to the packer in order to achieve the overpull and jar force required for recovery.

PRODUCT FEATURES

- Fully adjustable releasing force up to 120,000 lbs.
- Locked in mandrel allows for torque transmission
- Straight pull and rotate to release
- Rugged design to enable retrieval
- Full bore ID
- Rated to 10,000 psi
