

ROTATIONAL SAFETY SHEAR SUB

PRODUCT 20-039

The **TechWest Rotational Safety Shear Sub** is a tubing release assembly that allows the operator to disconnect from the tubing string when it is stuck downhole. The Safety Shear Sub is used when retrieval issues are anticipated (eg. in highly deviated wellbores, open hole completions or where debris is expected) and is often ran just above a tool or BHA.

The shear sub is designed such that it can freely rotate, and tubing torque is not transmitted to below.

The Safety Shear Release may also be used in certain stacked packer completions for emergency release.
