

HYDRAULIC TUBING DRAIN

PRODUCT 20-243

The **TechWest Hydraulic Tubing Drain** is a simple and reliable assembly used to equalize and drain the tubing prior to tripping out of hole. The drain is burst by differential pressure between the tubing and annulus. The burst pressure is predetermined based on the number of shear screws installed prior to running.

The tool is often ran above an insert or progressive cavity pump (PCP). If the insert pump or rotor can be retrieved, blowing the Tubing Drain allows the operator to equalize the tubing to avoid pulling wet tubing.

The tool is designed is designed for easy make up with tongs and for redressing, allowing multiple re-runs.
