

HYDRO-TRIP SUB

PRODUCT 20-069

The **TechWest Hydro-Trip Sub** is installed in the tubing string below a hydraulically actuated tool such as the HydroTech I Packer to provide a method of applying tubing pressure required to activate the tool. Premium threads available upon request.

Common Hydraulic activated tool are the HydroTech I, TH6 / 7 / 8, and the HSB, among others.

OPERATION

To set a hydraulic packer, drop or circulate a ball down the tubing to the seat in the Hydraulic-Trip sub. Apply sufficient tubing pressure to activate the setting mechanism in the packer. After the packer is set, a pressure increase shears the shear screws to allow the ball seat to move down until the fingers snap back into a groove. The sub is then full opening, and the ball passes on down the tubing.
