

MODEL S PERMANENT PACKER

PRODUCT 20-487

The **TechWest Model S Permanent Packer (15K)** is a high-pressure, opposing-slip, permanent packer that is hydraulic or wireline/e-line set, suitable up to 15,000 psi, depending on size. The Model S is similar to the Model L Permanent packer except with a reduced ID.

When set, back up rings provide 360° contact with the casing, preventing extrusion of the element at high temperatures or pressures. Solid one piece slips combined with locked-construction eliminate the danger of premature setting when running. The opposing-slips allow the tubing to be landed in compression or in tension.

The threaded bottom of the Model S Packer allows direct connection of Tubing Adapters, expendable Plugs, Millout Extensions etc.

OPERATION

The Model S Packer is set either hydraulically using a TechWest Model B Setting Tool (Product 10-270 and 10-271) and L Setting Adapter (Product 10-073) or on wireline using a Baker E-4 Setting Assembly.

Wireline/E-line allows for setting under pressure in a live well without the need for a snubbing or when the setting interval is tight and a precise landing depth is necessary.

The Model L may be removed by milling over and then retrieving.
